CARAPAX EIDER FENCE SYSTEM

The Carapax Eider Fence System has been developed in order to protect mussel farms from eider birds feeding of the crop. The system protects the farm by placing a protective perimeter around the farm stopping eider birds from swimming into the farm area. A 2.5 m high net is placed around the farm using vertical pipes to hold up the net up every 10 meters. The net stretches about 1.5 meters above the water surface and 1 meter below. The vertical pipes are attached to a main rope which in turn is attached to four corner anchors around the farm.
